## 3. Signature Feature: Goal Achievement Planner

Example: A user wants to purchase a laptop worth ■80,000 in eight months. The agent checks current goal savings, expected income, essential expenses, upcoming bills, and a safety buffer before proposing a savings plan.

**Required monthly savings** = (Target amount – Current goal savings) ÷ Months remaining

If the required contribution exceeds estimated safe monthly surplus, the agent should explain the shortfall and suggest alternatives such as extending the deadline, choosing a lower-cost option, or reviewing discretionary spending.

## 4. Security & Responsible AI

- Use strong authentication, server-side authorization, encrypted connections, and secure secret storage.

- Minimize sensitive data shared with AI models; validate tool inputs and ground responses in trusted financial data.
- Keep financial calculations in deterministic backend services rather than relying on free-form model arithmetic.
- Use read-only access by default. Require explicit user authorization and confirmation for consequential actions.
- Test access control, calculation correctness, forecast error, response latency, and AI groundedness.
